

GardPass Space

The vital space domain is increasingly congested and contested, making threat mitigation essential for sustaining an operational space environment.

Our capabilities provide assurance for the sustained use of the space environment upon which we all depend.

Combining cybersecurity expertise with high-security military satellite payload protection measures, we are leading the fightback against adversaries.

All space assets are vulnerable to environmental impacts and interference, whether intentional or otherwise. Risk management is essential for the protection of friendly assets in space.

GardPass's holistic approach to space system protection, through tailored security products or cyber consultancy, is key to sustaining operations.

- **Delivering Situational Awareness:** Enabling smart visibility of the “big picture” of the space environment.
- **Securing the System:** Focusing holistically on the cyber security of the Space Environment.
- **Managing Assets, Threats, Risks & Identities:** Ensuring the integrity of all the components of the system.
- **Protection of Ground Stations & Data Links:** Managing the components supporting the space assets.
